GDTCR: journal fit and submission route

Official instructions and 2025 impact factors checked on 3 November 2026

Recommendation. Prepare the current study as a BMC Bioinformatics research article. Briefings in Bioinformatics is a conditional alternative if the supervisor considers the comparative insights sufficiently broad. Bioinformatics is a weaker fit for the present contribution because its instructions emphasize substantial methodological advances. Impact factor alone does not determine fit, and this assessment does not predict acceptance.

Journal / 2025 JIF	Relevant format	Assessment for this study
BMC Bioinformatics / 4.4	Research article. Abstract at most 350 words: Background, Results, Conclusions; 3–10 keywords. Main text uses Background, Methods, Results, Discussion and Conclusions.	Best current fit: sequence analysis, computational modeling and scientific validity. Preserve controls, negative findings and bounded claims; finalize declarations, access and licensing before submission.
Briefings in Bioinformatics / 7.3	Methods comparison/benchmarking is within scope. Problem-solving protocols and case studies: 2000–5000 words; the selected article category must fit the contribution.	Possible higher-impact alternative. The single model family and source-concentrated corpus limit breadth. A broader method comparison and a sufficiently independent cohort would strengthen the case; these are study-specific recommendations, not universal journal requirements.
Bioinformatics / 5.5	Original Papers: up to 7 formatted pages, approximately 5000 words excluding figures. New methods must be compared with state-of-the-art methods.	Current priority is lower. The journal discourages routine applications and incremental benchmark gains without a substantial methodological advance. Additional formatting alone would not address that contribution gap.

Practical route. Review the current scientific draft first. If BMC remains the target, finalize authorship, statements, permissions, code/weight licenses and the data/code version, then apply the final journal checklist. A new external cohort, broader modern baselines or matched-total-computation experiments should be treated as separately scoped extensions if the supervisor requests them; they are not claimed as completed in this draft.

Official sources. The figures above are the same-year journal impact factors, not CiteScores or five-year impact factors.

1. BMC: metrics, scope, research-article instructions.
2. Briefings: metrics, article categories and scope.
3. Bioinformatics: metrics, article categories and contribution criteria.
